A1 A Note on the Donor-Reported GEPM Data

In this paper, we rely on data from the OECD DAC Policy Marker System—and specifically, its Gender Equality Policy Maker (GEPM). This tool asks DAC donors to assess each of their aid activities for whether the promotion of gender equality is either that project’s “principal” or a “significant” goal. This process is referred to as “screening” for the GEPM: screened aid activities are reported with values of zero, one, or two for their “Gender” variable. We describe projects with a value of either one or two as “marked” for gender: i.e., these are cases where the donor reports to the organization whether a project targeted gender equality or not, and to what extent. Conversely, if a donor fails to screen a given project—if it fails to assess and report whether that project targeted gender equality or not—its respective “Gender” variable is left as missing data, and we describe the project as “not screened.”

As this process suggests, all DAC data on gender targeting in its members’ foreign aid are donor-reported. This is far from exceptional: all DAC foreign aid data is donor-reported—i.e., the data used in the vast majority of the scientific literature on foreign aid as well as by IOs and development practitioners. To understand the data-generating process and the trustworthiness of these figures, we researched organizational documents and gathered information from DAC staff responsible for collecting and managing the organization’s data.

First, it’s important to understand that the OECD DAC provides its member states with tools and guidelines to help facilitate their data collection. Donors submit project-level information about their aid-giving to the DAC Creditor Reporting System (CRS) using spreadsheets and coding procedures thoroughly outlined by the organization. New members get trained on these data collection protocols, and all DAC donors can get detailed feedback on this in the context of the organization’s Statistical Peer Reviews.

Second, in the year-to-year reporting practice, donors are not left alone in the implementation of these guidelines. The DAC Network on Gender Equality (GenderNet) is the official working party where DAC donors develop policies and practices to promote the rights of women and girls through their aid giving. Within this group, DAC members share notes on their GEPM use and work to ensure a comparable standard—so as to ensure that all donors have a common understanding of what it means for a project to “principally” or “significantly” target this policy goal. GenderNet meeting agenda documents typically feature allotted time for a couple of donor countries: for example, in November 2017, representatives of the Swedish International Development Cooperation Agency (SIDA) presented on their experience applying the GEPM and then there was time allotted for “sharing experi-

ences and discussion amongst members on applying the marker and on the impacts of the new minimum standards on measuring aid to gender equality, and decision on priorities for analytical work on aid targeting gender equality in 2018” (GenderNet 2017).

Third, the DAC data team routinely performs qualitative checks on these data. For instance, if a project is marked as targeting gender equality through the GEPM but the rest of the available CRS project-level characteristics suggest differently, DAC staff is likely to follow up and ask that the donor double-check on that coding and provide additional information to justify it; similarly, if a donor reports a large proportion of its CRS project-level data without screening for the GEPM, they can expect DAC staff to follow up and check on that missingness as well.

In principle, it is nonetheless possible that some donors might engage in behavior akin to the so-called “pinkwashing”—i.e., donors might be a little more liberal in marking projects as “significantly” targeting gender equality as a way to virtue signal. Through our research, we have not uncovered evidence to this effect, and instead we note that donors with explicitly feminist foreign policies are likely actually integrating programming elements in support of gender equality across the majority of their aid activities.

Lastly, according to DAC staff responsible for handling these data, it is not reasonable to expect that projects targeting gender equality will always include explicit references to that effect in the project title and description as reported in the CRS. Rather, information about how a project targets gender equality is often only available in full project documentation, not summarized in CRS data. In other words, it would be misleading to infer instances of “pinkwashing” simply because no references to women or girls are found in projects’ titles and brief descriptions in the CRS.

A2 Descriptive Statistics and Figures

Figure A1: Top and Bottom Recipients of Aid for Gender Equality, 2018–2022

Top and bottom 15 recipients of gender-equality aid (GEPM = 1 or 2) in our sample, considering the 2018–2022 average in aid commitments from all DAC member donors. The figure shows the percentage of the total aid commitments they receive marked as having gender equality as their primary goal (dark gray) or as gender mainstreaming (light gray); black dots indicate the percentage of aid commitments designated with gender-related purpose codes.

A3 Recipient Fixed Effects

Table A1: Replication of Table 1 with Recipient Fixed Effects

Linear regressions at the recipient-year level (Models A1–A4) and donor-recipient-year level (Models A5–A6). Data built by aggregating positive commitments from all Official Development Assistance activities from 31 donor members of the OECD’s Development Assistance Committee, 1998–2022.

A4 Alternative Measures of Regime Type

Table A2: Replication of Table 1 with Regimes of the World Ambiguous Coding
 Linear regressions at the recipient-year level (Models A7–A10) and donor-recipient-year level (Models A11–A12). We re-code ambiguous cases of the Regimes of the World variable so as to count them as autocracies. This entails taking observations that the V-Dem variable “Regimes of the World: the RoW measure with categories for ambiguous cases” (`v2x_regime_amb`) codes as “electoral democracy lower bound” and considering them as autocracies in our binary coding, as a way to be conservative.

Table A8: Replication of Table 1 with Outcome: Commitment to Gender-Related Sectors
 Linear regressions at the recipient-year level (Models A43–A46) and donor-recipient-year level (Models A47–A48). Data built by aggregating positive commitments from all Official Development Assistance activities from 31 donor members of the OECD’s Development Assistance Committee, 1998–2022. Activities to gender-related sectors are indicated with purpose codes 15170 (“women’s rights organization and movements, and governments institutions”) and 15180 (“ending violence against women and girls”).

	% Commitments to Gender-Related Sectors					
	(A43)	(A44)	(A45)	(A46)	(A47)	(A48)
Democracy	0.187** (0.066)	0.171* (0.076)	0.177* (0.080)	0.125 (0.292)	0.141 (0.124)	0.066 (0.390)
Quota	0.087 (0.062)		0.075 (0.069)		0.299* (0.132)
